

DPF Manager 3.4 available to download

A lot of improvements and new features have been included in the [new release of the DPF Manager](#).

The most important changes are the inclusion of a **Quick Check** functionality that allows to perform a fast validation of the files, which can be later analyzed in more detail if desired performing a full check. Also, the reports now include **hints** that explain how to fix them (whenever possible). A new metadata fix has been added to solve ascii encodings (a common baseline error, that is produced by many softwares and operating systems). And now, the **PDF reports** can be seen directly from the GUI (instead of opening an external PDF viewer).

This release also includes some minor improvements and a set of bugfixes, that can be seen in the [github page](#) and the list of issues closed in the [current milestone](#).

The benchmarking tool announced in the past release is in progress and will be ready in the release of July.
